## Detailed Information

### 1. M4154 Input Voltage Operation.

The M4154 steady state operation voltage is 18V to 48V and will continuously work up to 50V/80V Input line.

When configured to support MIL-STD 704/1275 transients or surges, the unit will shut down when input voltage rises above 60V or Under 16V for more than 2Sec and immediate shut down under 12V or above 100V Input. Power supply automatically recover when Input goes back to normal steady state line.

**Please Note:** Working at steady state low line under 22V may exceed connector 40A current limitation.

Unit can be calibrated to work steady state or to be limited by 10 Sec to support Input transients during low line.

Note: 1275E configuration is optional, contact Factory.

#### 1.1 Steady state Low Line Turn-on and Turn-off Limits

To avoid Turn-on and Turn-off glitch the unit have about 2V Hysteresis. The Turn-on threshold is under 20V and turn- off under 18V.

Those limits can be adjusted, contact Factory for more information.

### 2. Outputs Voltage Regulation

The M4154 contains accurate internal sense lines to keep output voltage at less than 4% regulation for all Line/ Load and temperature range (see Table 2).

Output Voltage Range	12V/64A	3.3V/15A
Active Current Share	11.85V - 12.15V	3.28V - 3.42V
Passive Current Share	N/A	3.25V - 3.45V

Table 2: Outputs voltage regulation. VIN 18V to 48V, Temperature -55 to 85 °C

#### 2.1 Sense Lines

*Sense Lines* are provided for VS1, VS2 and VS3 output to compensate line voltage drop. *Sense Lines* proper connection is shown in Figure 3.

Each VSx output has its own *Sense Lines*, additional common *Sense RTN Line* is provided for all VSx Outputs (VITA 62 Standard).

Contact Factory for Sense configuration different than the VITA 62 standard

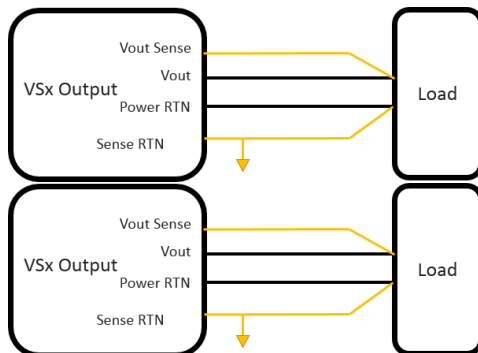

Figure 4: M4154 Sense line connection

### 3. Current Share (C.S)

Current Share of two or more units is optional (Contact Factory)  
 12V output and 3.3VAux will current share with about 2-4A load balance.

#### 3.1 Active current sharing (A.C.S)

Current sharing done in a closed loop. All paralleled outputs are compared and feedback is used to balance their load current. The result is a more stable, less sensitive output voltage without voltage drop. Typical Load Balance of about 2-4A for all Load range is expected.  
 ACS is supported by the 12V output. Optional for 3.3Vaux<sup>1 2</sup>.

#### 3.2 3.3Vaux Passive Current Sharing (P.C.S).

Current sharing is done in open loop, output voltage drops as a function of output load.  
 Load Balance of about 5-10% is expected.  
 3.3Vaux ACS is optional<sup>1 2</sup>

#### 3.3 Current share connection between two Units.

For a required output to current share please connect the following Pins between the two units

- *PO#\_Sense & PO#\_Sense\_RTN* (for best performance, Pins from paralleled units should be connected to a single point and as close as possible to the load point)
- *VSI\_SHARE (A7)*
- *VSI\_ACS (C7)*
- *3.3Vaux\_SHARE (B7)*
- *3.3Vaux\_ACS (D1)* Optional<sup>1 2</sup>

Typical ACS Dynamic Load of Two 12V Paralleled Outputs (PO1 & PO2 refer to two different units)

Notes 1. When Not used, 3.3Vaux A.C.S can be left open.

When ordering 3.3Vaux P.C.S or 3.3Vaux Non-Current Share unit, this pin is Internally disconnected

2. 3.3Vaux ACS (Pin D1) is not required by SOSA and is optional. (Pin was previously on Pin B4)

**7. Sync In and Switching Frequency**

Standard switching frequency with no Sync In signal applied is 220kHz  $\pm$ 5%.

When optionally configured to have Sync In functionality the unit will sync to a signal between 200kHz and 300kHz  $\pm$ 5%. The square wave must be at 3.3V CMOS standard logic levels with a duty cycle between 20% and 80%.

The M4154 will sync after 32 cycles of within tolerance external clock cycles. The unit will revert to its internal clock frequency upon any out of specification clock cycles and will need 32 good cycles to resync to the external clock.

Contact factory to add Sync\_in functionality and to customize its configuration values.
