**Note:**

1. The SIGNAL RTN is referred to the input.
2. SINGAL RTN is the return path for SYNC IN and INHIBIT signals

## Functions and Signals

### **INHIBIT signal**

The **INHIBIT** signal is used to turn the power supply ON and OFF.

TTL “1” or OPEN – will turn the power supply ON (For normal operation leave the signal not connected).

TTL “0” or short– will turn the power supply OFF.

This signal is referenced to the **SIGNAL RTN** pin.

### **SYNC IN signal**

The **SYNC IN** signal is used to allow the power supply frequency to sync with the system frequency.

The system frequency should be 250 kHz  $\pm$  10 kHz.

When not connected the power supply will work at 250 kHz  $\pm$  10 kHz.

This signal is referenced to the **SIGNAL RTN** pin.

### **SIGNAL RTN**

The **SIGNAL RTN** pin is used as a return path for **SYNC IN** and **INHIBIT** signals.

This pin is referenced to the **VIN RTN** pin.

### **SENSE 1**

The **SENSE 1** is used to achieve accurate load regulation at output #1's load terminals. This is done by connecting the pins directly to the load terminals. The remote sense correction function is limited to voltage drop between converter's output and load terminals of 2% to 5%, or up to 0.5V, the least of the two.

When not used, connect **SENSE 1** to **OUT 1** and **SENSE 1 RTN** to **OUT 1 RTN**. These pins can be tied internally if not required, to avoid adding this external connection – *consult factory*.
